

Graded Assignment - 1

C1. Supervised	Unsupervised	Reinforcement
i) It is been given labelled input to have labelled output.	i) It is given data and is used to make predictions out of it.	i) It uses reward and punishment to actually self-correct the model and penalize when necessary.
ii) It is been given words that signal spam email so it uses the data to filter out spam/hot spam emails	ii) It is used for ^{stock price} fraud detection. While the ^{prices} fraud happens find to group and learn the patterns and understands it to give the output.	ii) It is used in library management system where the model will penalize itself for finding the ^{data} students name match and incorrectly.

C2. ML is better than rule-based fraud detection system:-

- i) It finds patterns and uses it for future.
- ii) It ~~is~~ can be optimized more (strictly)
- iii) It can prevent fraud at the beginning by looking at the activity relating it to the past pattern.

C3. Model C is Overfitting. Model A or B is that Model B should be as it has overall lower RSME than A.
